DETAILED ACTION

1. Claims 1-11, 13-28 and 32-37 were examined.
2. Claims 12, and 29-31 were cancelled.

Section I: Non-Final Rejection

Claim Rejections - 35 USC § 112

3. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

4. Claims 1-11, 13-24, 32-37 are rejected under 35 U.S.C. 112, second paragraph, as being incomplete for omitting essential structural cooperative relationships of elements, such omission amounting to a gap between the necessary structural connections. See MPEP § 2172.01. The omitted structural cooperative relationships are as follows: (claim 1, for example) the limitation is silent as how does one reduce delays.

Claim Rejections - 35 USC § 101

5. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor; subject to the conditions and requirements of this title.

- Claims 1-11, 13-24, 32-37 are rejected under 35 U.S.C. 101 because the limitations denote function language does not provide a concrete tangible end result.

Section II: Allowable Subject Matter

6. Claims 25-28 are allowable.

7. The following is an examiner's statement of reasons for allowance:

While US Patent 5,648,913 teaches (claim 25) the desired circuit delay using a timing optimization process, wherein in an iteration, mapping and clustering are used of measure the outcome of the timing optimization procedure, and wherein the timing optimization, none of these references, taken either alone or in combination, with the prior art of record disclose:

(claim 25) "a layout-driven logic synthesis design flow, comprising: selecting a desired circuit delay associated with a first output of a circuit path, wherein other outputs are associated with different initial circuit delays; calculating an initial circuit delay associated with the first output; and iteratively reducing the initial circuit delay to achieve process uses such measurements to achieve the desired delay, and wherein the result of an interaction of delay reduction is used by a next iteration of delay reduction to determine an amount of delay to reduce"

in combination with the remaining elements and features of the claimed invention. It is for these reasons that the applicants' invention defines over the prior art of record.

Art Unit: 2123

8. Claims 25-28 are allowable. Furthermore, all the claims are novel in view of the prior art only; however, the remaining claims have issues outstanding. Applicants are currently researching possible solutions to this issue as agreed to.
